

AMENDMENTS TO THE CLAIMS:

1. (cancel)

Q1  
2. (currently amended) A method for detecting the presence of microorganisms in a sample, comprising the step of:

check  
P1  
(a) preparing a light-permeable microorganism colony culture medium mixed with a sample;

(b) illuminating said medium with coherent laser beam;

(c) receiving the light projection generated by said medium with image sensor;

the presence of microorganisms being detected by analyzing the projected image data obtained by said image sensor.

3. (currently amended) A projection detecting system comprising:

(a) a loading portion of [an object] a transparent nonflowing cell container which contains a microorganism colony under observation;

(b) a coherent laser beam emitting source which illuminates the object placed on said loading portion; and

(c) an image sensor which is an array of light sensitive detectors; arranged to receive [the] light projection generated by said object illuminated by said laser beam and providing the projected image data corresponding to each detector.

4. (currently amended) The projection detecting system as described in claim 3 comprising:

*Sz*  
*DI*  
(a) multiple loading portions capable of accommodating many [objects] of said transparent nonflowing cell containers under observation in a row;

(b) a coherent laser beam emitting source which illuminates through said [objects] transparent nonflowing cell containers placed on said loading portion; and

*Q*  
(c) an image sensor which is an array of light sensitive detectors, arranged to receive the compounded light projection generated by said [objects] transparent nonflowing cell containers illuminated by said laser beam and providing the projected image data corresponding to each detector.

5. (currently amended) The projection detecting system as described in claim 3 comprising:

(a) a loading portion for [an object] a transparent nonflowing cell container which contains a microorganism colony under observation;

(b) three coherent laser beam emitting sources which illuminate said [object] transparent nonflowing cell container placed on said loading portion from X, Y and Z direction which are perpendicular to each other; and

(c) three image sensors which are an array of light sensitive detectors, arranged to receive the light projection generated by said object illuminated by said laser beams from X, Y and Z

direction respectively and providing the projected image data corresponding to each detector as X, Y and Z image data.

*Sub*  
*701*  
6. (currently amended) The projection detecting system as described in claim 3 comprising:

*Q1*  
(a) a loading portion which holds an object under observation and is capable of rotating said object with constant angular velocity around center axis that passes through the center of said object;

(b) a coherent laser beam emitting source which illuminates [said object placed on said loading portion] from the direction perpendicular to the axis of rotation[;

(c) an image sensor which is an array of light sensitive detectors, arranged to receive the light projection generated by said object illuminated by said laser beam and providing the projected image data corresponding to each other].

*Q2*  
7. (New) The projection detection system as claimed in claim 6, wherein said object is a transparent cell container which contains a microorganism colony.

rotates at constant angular velocity. Therefore, it would not be obvious to utilize a stepper motor of Cremer as the Examiner has asserted.

New Claim 7

New claim 7 further defines the object under observation in claim 6 as the transparent cell container which contains a microorganism colony. The Examiner should note that claim 7 does not use the term "nonflowing".

In view of the foregoing, it is respectfully submitted that the application is now in condition for allowance, and early action in accordance thereof is requested. In the event there is any reason why the application cannot be allowed in this current condition, it is respectfully requested that the Examiner contact the undersigned at the number listed below to resolve any problems by Interview or Examiner's Amendment.

Respectfully submitted,

Ronald R. Snider
